

Whisp

Urban Focus Space Network

A city-focused service platform that evaluates noise, comfort, lighting and connectivity to recommend better places for focus.

From Noise to Focus

We selected this symbol for its dynamic and open-ended form, which allowed us to reinterpret it as a system of noise, movement, and focus.

- Scattered particles represent distraction, movement and urban noise.
- The dense center symbolizes calm, clarity and concentration.
- Its circular rhythm suggests transition — from chaos to focus.

Symbol Evolution

From an expressive,
hand-drawn form to a more structured
and scalable identity mark.
The final version improves balance,
radial consistency, and digital adaptability.

Children's Cognition: Long-term exposure (near airports/main roads) decreases reading ability by 20%, accelerates memory decline by 2.3 times, and increases the risk of delayed language development by 19%.

Sleep: Nighttime noise >40dB disrupts sleep structure; cortisol increases by 41%, melatonin decreases by 63%, immunity declines, and the risk of depression increases.

Investigatio

WHO Noise Health Guidelines

Key Conclusion: Noise is the second leading environmental killer of public health (after air pollution):

Quietness is not a luxury or a preference, but a biological necessity for human neurophysiology, cognitive function, and mental health. A prolonged lack of quiet environments can lead to insufficient brain repair, attention deficit, chronic stress, and various psychosomatic illnesses. Quietness (natural soundscape < 45 dB) is an irreplaceable ecosystem service, directly providing stress relief, cognitive recovery, and spiritual nourishment. Urbanization is causing a 18% reduction in quiet areas globally every 10 years, threatening human physical and mental health. Quiet green spaces in cities with a soundscape of 45–50 dB can significantly enhance feelings of recovery (ROS score +0.98), reduce cortisol, and improve mood; soundscapes above 60 dB completely lose their restorative function.

Metabolic: For every +5dB of traffic noise, waist circumference increases by 1.51cm, and the risk of type 2 diabetes increases by 8%.

Cardiovascular: Long-term nighttime noise (≥55dB) increases the risk of hypertension by 20%, coronary heart disease by 29%, and stroke by 15%; for every 10dB increase, systolic blood pressure increases by 2–3 mmHg..

Sleep

<30 dB: Extremely quiet deep sleep zone, optimal for nerve repair and stable melatonin secretion.

30–40 dB: Ideal quiet threshold at night, no sleep interruptions, no physiological stress.

40–45 dB: Mild nighttime disturbances, increased light sleep, decreased proportion of deep sleep.

45–50 dB: Frequent nighttime awakenings, vivid dreams, and chronically mildly elevated cortisol levels.

>50 dB: Definite nighttime pollution, fragmented sleep structure, increased risk of neurasthenia.

>55 dB: Long-term nighttime exposure, threshold for triggering chronic cardiovascular diseases.

Sensitive groups

Children, the elderly, and pregnant women: An overall threshold increase of 5 dB can cause equivalent harm.
Children with a long-term threshold >50 dB: Impaired cognitive, language, and memory development.
Sensitive individuals with a threshold >40 dB: Sleep disturbances and emotional sensitivity may occur.

Key Thresholds

Noise level

Daily activites

<35 dB: Optimal focus range for office work/study/meditation, zero attention expenditure

35–45 dB: Comfortable indoor environment, suitable for reading, thinking, and detailed work

45–55 dB: Suitable for everyday conversation, prolonged sitting can easily lead to attention fatigue

55–65 dB: Noticeably noisy, decreased focus, irritability

65–70 dB: Continuous noise stress, heart rate fluctuations, increased anxiety

Health

≥55 dB (long-term diurnal exposure): Hypertension +20%, coronary heart disease +29%, stroke +15%

≥60 dB: Chronic stress normalization, endocrine disorders, metabolic abnormalities

≥70 dB: Sustained sympathetic nerve excitation, high incidence of insomnia, tinnitus, and migraines

≥75 dB: Continuous auditory burden, chronic strain on the auditory nerve

≥85 dB (8-hour daily average): The safety threshold for permanent hearing loss

≥90 dB: Short-term exposure can cause auditory fatigue and eardrum discomfort

≥110 dB: Short-term exposure carries the risk of irreversible hearing loss

Concept

In contemporary urban environments, noise, lighting and other environmental factors continuously affect people's ability to focus.

Attention has become a scarce resource in urban life.

Cities are full of places to sit, but few places to focus. Productivity is shaped by environment.

Whisp proposes a new way of understanding cities by re-evaluating space from multiple dimensions.

We provide:

- Noise level
- Wi-Fi quality
- Seating comfort
- Power outlets
- Crowd density
- Suitability of stay duration
- Lighting

Whisp

NOISE / STRESS / NEED

Whisp is a city-focused platform that helps people find better spaces for focus.

Whisp Urban Focus Space Network

Moodboard

Whisp helps people find better spaces to focus in the city.
We turn environmental data into clarity, calm and better choices.

From Noise
Distraction, movement,
urban pressure.

To Focus
Calm, clarity,
concentration.

Better Choices
Data-informed, human-
centered decisions.

Typography

TIMES

****Clear Serif Structure:**** Strokes end with delicate serifs; horizontal strokes are thin, vertical strokes are thick, and the contrast is moderate. The x-shape is high, the letter-space is spacious, and the falling stroke is short, maintaining sharpness even at small font sizes (6–12pt).

NEWROMAN

WHISP

****Compact, Efficient, and Space-Saving:**** The font width is relatively tight, and line spacing can be set to be denser. It saves 10%–15% of space compared to sans-serif fonts for the same number of characters, making it suitable for news, note-taking, and reader apps.

Latīna

****Full Character Coverage and Multilingual Support:**** The MT Std version supports all Unicode characters (Latin/Greek/Cyrillic/Phonetic/Multilingual Pronunciation), making it compatible with apps worldwide.
